Welding demo

Introduction & definition

TIG DynamicWire is based on active control of the wire feed.

- ⊕ The actively interacting wire control expands the parameter window and simplifies handling.
- ⊕ The wire feed speed automatically adjusts to the amperage, arc length and seam type.
- ⊕ TIG DynamicWire works in Synergic mode!
Current and wire feed speed do not have to be set separately.
- ⊕ There are individual characteristics for different wire diameters and alloys.
- ⊕ The fine-tuning of the wire feed speed can be done using the wire correction.

Basic principle

A **voltage** can be measured between the workpiece and the wire.

An **additional sensing interface** has been added to the existing SR63. In addition, the print "**WiVolt**" is needed to measure the voltage between the base material and the wire.

Basic principle TIG DynamicWire

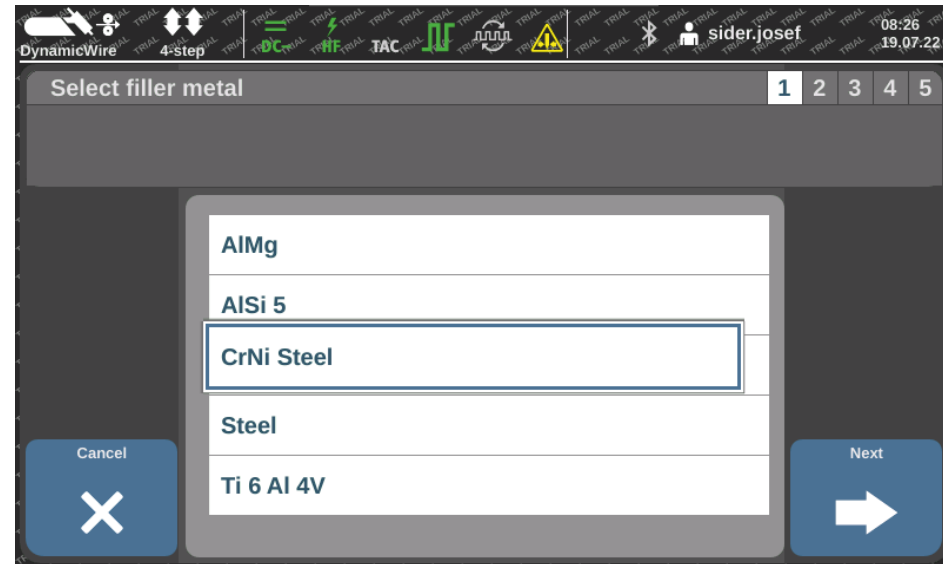

TIG synergic lines

Fronius is the world's first provider of an active wire regulation for TIG cold wire welding!

Different synergic lines for the most common filler materials are available as soon as the welding package TIG DynamicWire is activated!

End delay: 0,3s
Wire retract (end): 2mm

* Wire position (start): off
Start delay: off
End delay: off
Wire retract (end): off

Wire control in case of tolerances

The average wire feed speed adapts to the arc length or to the gap that has to be bridged because of TIG DynamicWire, e.g. varying gap between 4 and 0mm

Weaving OFF

Weaving ON

SAMPLE

8mm sheet metal SS 1.4301

fillet weld

Practical advantages

Dynamic wire control results in a number of application-related advantages, e.g.

- ⊕ **Improved wetting behaviour** (excitation of the weld pool)
- ⊕ Helps in case of **component tolerances** because the wire feeding regulates the amount of filler material
- ⊕ Component tolerances up to 30% are automatically compensated
 - * Example: With a corner joint of CrNi steel (1.4301 / X5CrNi18-10) and a material thickness of 10mm, a gap bridging of 3mm (30%) is achieved in PA position.
- ⊕ **Application-specific set-ups / characteristics** available
- ⊕ **Simplified operation & paramet** (set only 1 parameter)

- ⊕ Wire and current no longer have to be set separately thanks to

SynergicMode

TIG

Wire feeding variants

Wire feeding for manual applications

Change of tungsten electrode with TFC system

(Tungsten Fast Clamp, similar to „lead pencil system“)

Decoupled wire feeding system

DynamicPen

The DynamicPen is now available as an alternative to the standard cold wire feeding system (CW-Feeding Standard). The decoupled cold wire feeding system offers maximum flexibility for difficult accessibilities.

Details can be found in the presentation „[TIG manual welding torches next generation](#)“.

Wire feeding for automated applications

CW-Feeding Standard

recommended for CONV applications!

Detailed information on automated wire feedings can be found in the presentation „TIG torches automated“.

CW-Feeding Low Friction

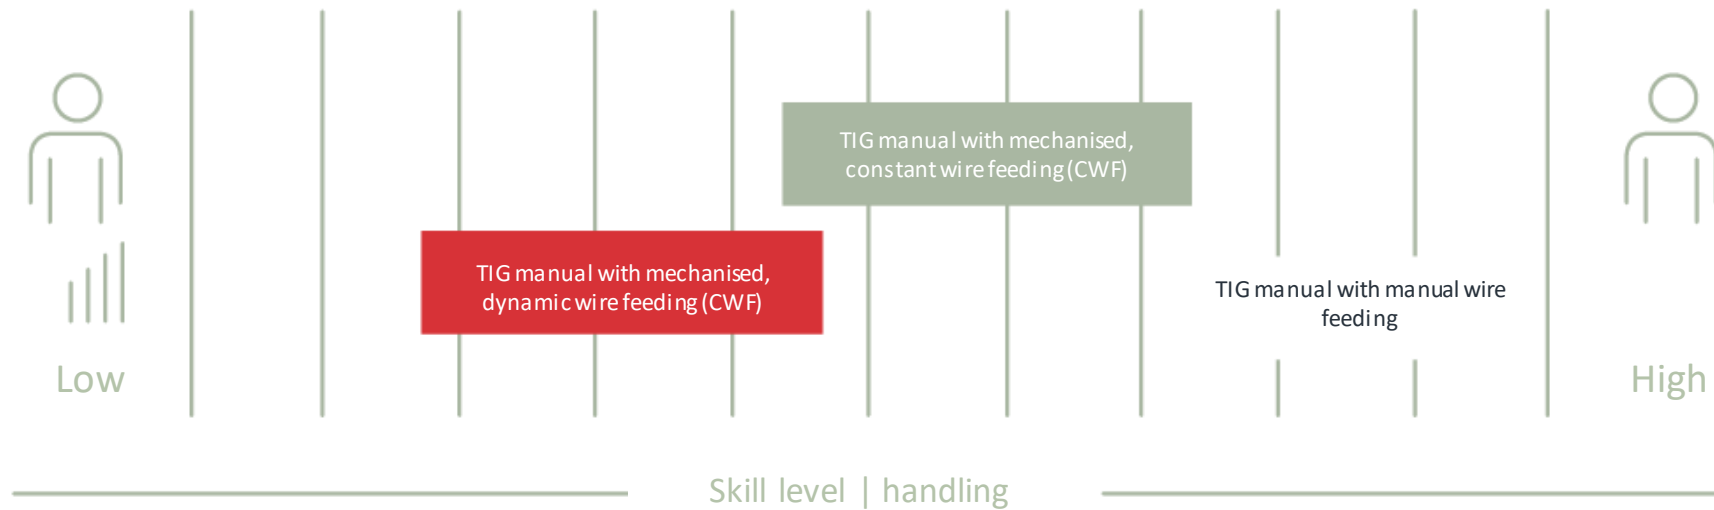

recommended for PAP applications!

Detailed information on automated wire feedings can be found in the presentation „TIG torches automated“.

Additional settings on the MCU

Additional settings on the MCU

Recommended
wire distance

Wire distance to the tungsten electrode

Current range [A]	Wire distance to tungsten electrode [mm]
40 - 150	0.5 – 1.5
150 - 260	1.5 – 2.5
260 – 320	2.4 - 4

Universal setting: 2 mm

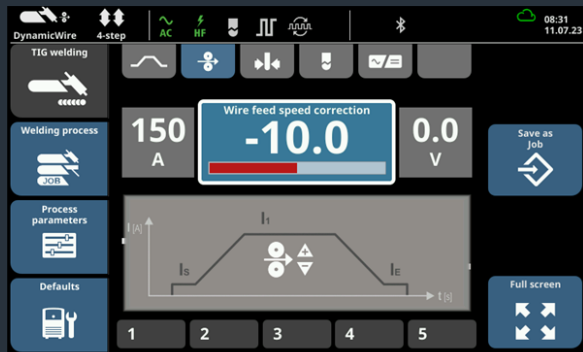

Wire feed
speed correction

Wire feed speed correction

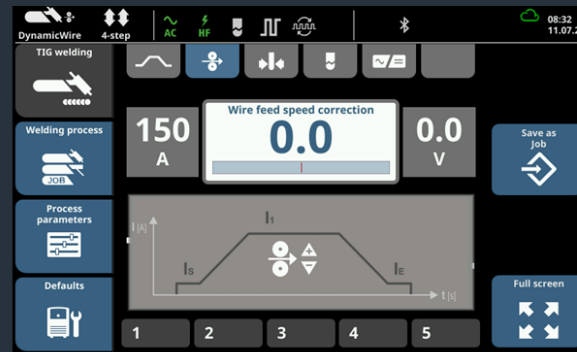

The parameter „wire feed speed correction“ allows the welder to correct the wire feed in the positive or negative range. This setting influences the penetration depth, weld seam surface, effective throat thickness and welding speed.

Welding demo

TIG DynamicWire

Pipe-flange connection

„I went to several customers to demonstrate TIG DynamicWire. All customers became enthusiastic after these demos. They were all a bit sceptical about automatic wire feed system combined with (manual) TIG welding. After seeing the process they all wanted to try the system and the simplicity and easy going with this process convinced all welder that this is a great solution!“

“The best welding demo was at a customer where the welder already tried 4 other systems from competitors / welding equipment manufacturers. He was really mad about the fact that his boss wanted to try another system, again.... We started our demo with a very negative welder but after seeing and trying our system he became enthusiastic. He wanted this system for his tasks! This was such a great experience! All other systems failed at the demo but ours did what a welder wants!!”

Patrick van Deuren, EQIN
