Issue 1 - 2019

MATERIALS & SAFETY - R&D

TR 31314

page 1 of 18

FORM C TYPE TEST VERIFICATION REPORT

Type Approval and **Manufacturer** declaration of compliance with the requirements of G98/NI.

This form should be used when making a Type Test submission to the Energy Networks Association (ENA).

If the **Micro-generator** is **Fully Type Tested** and already registered with the ENA **Type Test Verification Report** Register, the **Installation Document** should include the **Manufacturer**'s Reference Number (the Product ID), and this form does not need to be submitted.

Where the **Micro-generator** is not registered with the ENA **Type Test Verification Report** Register this form needs to be completed and provided to NIE Networks, to confirm that the **Micro-generator** has been tested to satisfy the requirements of this EREC G98/NI.

Manufacturer's reference number			Fronius Symo GEN24		
Micro-generato	r technolo	ogy	transformerless		
Manufacturer n	ame		Froni	us International Gr	mbH
Address				ter Fronius Str 1 Wels-Thalheim, A	Austria

connection optic	on.		kW two phases in three phase system		
			kW two phases split phase system		
Type Tested re this document,	ference n prior to s	umber will be manufa	actured that no	and tested to en	ed by the company with the above sure that they perform as stated in as are required to ensure that the
Signed FRONUS INTERNATIONAL GABH Gunter Frontier State of the State of			ehalf of	Fronius International GmbH	
Note that testing house.	g can be	done by the Manufa	acture	r of an individual	component or by an external test

Where parts of the testing are carried out by persons or organisations other than the **Manufacturer** then that person or organisation shall keep copies of all test records and results supplied to them to verify that the testing has been carried out by people with sufficient technical competency to carry out the tests.

MATERIALS & SAFETY - R&D

page 2 of 18

Operating Range: This test should be carried out as specified in EN 50438 D.3.1.
Active Power shall be recorded every second. The tests will verify that the Micro-generator can operate within the required ranges for the specified period of time.
The Interface Protection shall be disabled during the tests.
In case of a PV Micro-generator the PV primary source may be replaced by a DC source.
In case of a full converter Micro-generator (e.g. wind) the primary source and the prime mover Inverter /rectifier may be replaced by a DC source.
In case of a DFIG Micro-generator the mechanical drive system may be replaced by a test bench motor.
Test 1
Voltage = 85% of nominal (195.5 V)
Frequency = 47.5 Hz
Power factor = 1
Period of test 90 minutes
Test 2
Voltage = 110% of nominal (253 V).
Frequency = 51.5 Hz
Power factor = 1
Period of test 90 minutes
Test 3
Voltage = 110% of nominal (253 V).
Frequency = 52.0 Hz
Power factor = 1
Period of test 15 minutes
Remark: During the tests 1, 2 and 3 the unit does not disconnect, tests have been passed.

Power Quality – Harmonics: These tests should be carried out as specified in BS EN 61000-3-2. The chosen test should be undertaken with a fixed source of energy at two power levels a) between 45 and 55% and b) at 100% of **Registered Capacity**. The test requirements are specified in Annex A1 A.1.3.1 (**Inverter** connected) or Annex A2 A.2.3.1 (Synchronous).

page 12 of 18

Power Quality - Voltage fluctuations and Flicker: These tests should be undertaken in accordance with EREC G98/NI Annex A1 A.1.3.3 (Inverter connected) or Annex A2 A.2.3.3 (Synchronous) Starting Stopping Running d_{max} $d_{(\underline{t})}$ P_{st} d_c d_{max} $d_{(t)}$ P₁2 hours d Measured 0 0 1.35 1.25 0.028 0.038 -Values at test impedance Normalised 0 0 1.35 1.25 0.028 0.038 to standard impedance Normalised ----to required maximum impedance Limits set 4% 3.3% 3.3% 4% 3.3% 3.3% 1.0 0.65 under BS EN 61000-3-11 R Test 0.24 Х 0.15 Ω Ω Impedance R Х 0.24 * 0.15 * Standard Ω Ω Impedance 0.4^ 0.25^ Maximum R Х Ω Ω _ Impedance

* Applies to three phase and split single phase Micro-generators.

^ Applies to single phase **Micro-generators** and **Micro-generators** using two phases on a three phase system.

For voltage change and flicker measurements the following formula is to be used to convert the measured values to the normalised values where the power factor of the generation output is 0.98 or above.

Normalised value = Measured value*reference source resistance/measured source resistance at test point.

Single phase units reference source resistance is 0.4 Ω

Two phase units in a three phase system reference source resistance is 0.4 Ω .

Two phase units in a split phase system reference source resistance is 0.24 Ω .

Three phase units reference source resistance is 0.24 Ω .

Where the power factor of the output is under 0.98 then the X to R ratio of the test impedance should be close to that of the Standard Impedance.

The stopping test should be a trip from full load operation.

The duration of these tests need to conform to the particular requirements set out in the testing notes for the technology under test. Dates and location of the test need to be noted below.

Test start	10:14	Test end	12:14	21.12.2020
Test location		aboratories, Fronius Internationa is Str 1, A-4600 Wels-Thalheim,

Step a) 50.00 Hz ±0.01 Hz	8051W	50.00Hz		
Step b) 50.25 Hz ±0.05 Hz	7905W	50.25Hz		
Step c) 50.70 Hz ±0.10 Hz	6075W	50.70Hz		
Step d) 51.15 Hz ±0.05 Hz	4255W	51.15Hz	8.3kW	50%/Hz
Step e) 50.70 Hz ±0.10 Hz	6075W	50.70Hz		
Step f) 50.25 Hz ±0.05 Hz	7905W	50.25Hz		
Step g) 50.00 Hz ±0.01 Hz	8051W	50.00Hz		
Test sequence at Registered Capacity 40% - 60%	Measured Active Power Output	Frequency	Primary Power Source	Active Power Gradient
Step a) 50.00 Hz ±0.01 Hz	4054W	50.00Hz		
Step b) 50.25 Hz ±0.05 Hz	3960W	50.25Hz		
Step c) 50.70 Hz ±0.10 Hz	3042W	50.70Hz		
Step d) 51.15 Hz ±0.05 Hz	2129W	51.15Hz	4.1kW	50%/Hz
Step e) 50.70 Hz ±0.10 Hz	3042W	50.70Hz	1	
Step f) 50.25 Hz ±0.05 Hz	3960W	50.25Hz	1	
Step g) 50.00 Hz ±0.01 Hz	4054W	50.00Hz	1	
Steps as defined in EN 5043	8	1		

MATERIALS & SAFETY - R&D

page 17 of 18

Power output with falling frequency test: This test should be carried out in accordance with EN 50438 Annex D.3.2 active power feed-in at under-frequency and under steady state conditions.								
Test sequence Measured Active Frequency Primary power source Power Output Output Primary power source Primary power source								
Test a) 50 Hz ± 0.01 Hz	8000W	50Hz	8.2kW					
Test b) Point between 49.5 Hz and 49.6 Hz	8000W	49.55Hz	8.2kW					
Test c) Point between 47.5 Hz and 47.6 Hz	8000W	47.55Hz	8.2kW					
NOTE: The operating point	in Test (b) and (c) shall b	e maintained for a	at least 5 minutes					

Re-connection timer.						
Test should	Test should prove that the reconnection sequence starts after a minimum delay of 60 s for					
restoration o	of voltage and f	requency to	within the stag	e 1 settings of	Table 2.	
Time delay	Measured				nen voltage or fre	
setting	delay		brought to just	outside stage 1	limits of table 2.	
60.0s	99.2s	99.2s At 257.0 V At 191.5 V At 47.9 Hz At 52.1 Hz				
Confirmation that the Micro-generator does not re-connect.			Confirmed	Confirmed	Confirmed	Confirmed

Fault level contribution: These tests shall be carried out in accordance with EREC							
G98 Annex A1 A.1.3.5 (Inverter connected) and Annex A2 A.2.3.4 (Synchronous).							
For machines with electro-mag	gnetic output		For Inverter	output			
Parameter	Symbol	Value	Time after fault	Volts	Amps		
Peak Short Circuit current	i _p		20ms	4.24	49.4		
Initial Value of aperiodic current	A		100ms	3.6	22.4		
Initial symmetrical short- circuit current*	 k		250ms	3.43	14.3		
Decaying (aperiodic) component of short circuit current*	i _{DC}		500ms	3.4	10.3		
Reactance/Resistance Ratio of source*	×/R		Time to trip	0.110	In seconds		
	/ _R		trip				

For rotating machines and linear piston machines the test should produce a 0 s - 2 s plot of the short circuit current as seen at the **Micro-generator** terminals.

* Values for these parameters should be provided where the short circuit duration is sufficiently long to enable interpolation of the plot

Logic Interface.	Yes
Self-Monitoring solid state switching: No specified test requirements. Refer to EREC G98/NI Annex A1 A.1.3.6 (Inverter connected).	NA
It has been verified that in the event of the solid state switching device failing to disconnect the Micro-generator , the voltage on the output side of the switching device is reduced to a value below 50 V within 0.5 s.
